LARRY seat BANEX

• Original caster  
Consists of flat coil spring  
and silicon tube,  
Sizes 4 inches/5 inches.

• Footrest supporting the  
posture.  
• One-piece type with  
a pipe structure.  
• Left and right separate  
plate type  
Please select.

- The BANEX is a double layer weave of high strength nylon cord and polyester fiber, Pleasant its a gentle touch and ventilation effect. **LARRY GOLD/ Larry Autonomic Chair.** When sitting on LARRY, the lumbar support leans forward and the pelvis leans forward, the trunk is supported by the S-shape and the waist does not move forward. The seat and backrest's strong elastic fabrics are displaced by the suspension bridge under load to maintain autonomic the center of spinal cord in the sitting posture. As a result, the scoliosis of the neck and other areas has also been reduced, and more pronounced vocalizations crealy.

## Test ride • •

• **Mother of Male 23 years old:** I first put my son in LARRY, (My son has a deformed spine such as scoliosis, hip dislocation due to it, contracted so that there is no space for one finger between the the pelvis and libs, and the back and shoulder are stunning.)

It took less than 10 minutes, my mind totally changed. "Oh!" because, I saw my son self-supporting and fit in nicely by the seating in LARRY without any additional cushion to supporting his body! It was truly amazing! Then, further-more, I even was surprised to hear my son shout "I can do it!" with confidence tone. He now can adjust his body position by himself! My boy had been using a wheelchair even before his school age until 23 years old. **This was the first time event!** I can't believe he has such strength. Is this because of the angle setting of seating and back rest and the material of the seat?

**This touched me to the heart and "disappointment" and "regret" were totally gone!** (Autonomous displacement!)

• **13-years schoolgirl:** She was scoliosis body position fixed by a harness to the high backrest wheelchair.

At time of test drive • •  
Then, all of a sudden **after 20 minutes** during the test ride on LARRY Low Back rest, she starts to back warp her body and says "So nice and comfortable!" It was almost the "Ina Bauer" of figure ice skating performance. She repeatedly and gladly says "Well! So nice and comfortable! So nice and comfortable!" while she says so, her body trunk has been gradually straighten. Then she totally changes her expression, **She began to speak in a bright clear voice.**
